What Is Phentermine?

Phentermine is a prescription appetite suppressant that belongs to a class of medications known as sympathomimetic amines. It works by stimulating the central nervous system, helping reduce hunger and increase energy levels.

Doctors typically prescribe Phentermine for short-term use as part of a comprehensive weight management plan. It is most often recommended for adults with:

- A Body Mass Index (BMI) of 30 or higher
- A BMI of 27 or higher with weight-related health conditions
- Difficulty losing weight through lifestyle changes alone

Phentermine is not intended for cosmetic weight loss but rather for individuals who need medical support in managing obesity-related risks.
